Follow-Up Care Plan

Information and resources for breast cancer patients in Manitoba after completion of treatment.
Breast Cancer Navigator

- Helps you find your way as you move forward after treatment
- Provides information and support
- Answers questions
- Connects you to programs and resources in Winnipeg and across Manitoba

Call 1-888-660-4866 or 204-788-8080

For other Cancer Navigation Services available in rural Manitoba please refer to page 51
Welcome

This resource “Moving Forward After Breast Cancer” is Part 2 of 3 that you will receive as part of your Post Treatment Follow-Up Care Plan.

Part 1 of the care plan outlines your personal 5 year follow up test schedule, what symptoms to watch for, and what cancer treatment you had.

**If you have misplaced your Part 1 package, please call your oncologist’s office. They can print and mail you a new copy.**

Part 2 gives you breast cancer specific information about:

- follow up care
- side effects and what to do
- post treatment programs

Part 3 (Moving Forward After Cancer) is a resource focused on feeling well after treatment, reducing future risk, and resources and supports available in Manitoba after being treated for any type of cancer.

Part 2 (Moving Forward After Breast Cancer) and Part 3 (Moving Forward After Cancer) are available on line at: www.movingforwardaftercancer.ca.
Table of Contents

4 Follow up Care
  • How often should I see my family doctor? 4
  • What changes should I see my family doctor about? 4
  • What is my follow up plan? 5
  • What can I expect at each visit? 6
  • What tests do I need after breast cancer? Who books the necessary tests and who provides the results? 6
  • What changes should I see my family doctor about? 7
  • If I find a lump in my reconstructed breast, who do I go to? 7
  • I have been started on anti-hormonal therapy. Why? 8
  • I am on anti-hormonal therapy. What tests do I need and what should I watch for? 8
  • What can I expect at each visit? 9
  • Who writes the ongoing anti-hormonal therapy prescriptions? 9

CancerCare Manitoba’s Follow-Up Recommendations for breast cancer patients were adapted from the latest American Society of Clinical Oncology (ASCO) guidelines, which are considered the most stringent guidelines based on the best research from around the world.

How often should I see my family doctor?
You should see your family physician* for a visit and physical exam every six months for five years, then yearly.

*when we refer to family physicians in this booklet, we are also including primary care nurse practitioners.

Don’t have a family physician or nurse practitioner?
UPCON Primary Care Finder: referral from oncologist or oncology nurse is required.
Ph: 204-787-1229   Fax: 204-786-0715

Family Doctor Connection Program
Ph: 204-786-7111 or 1-866-690-8260

“What changes should I see my family doctor about?”
For many people finishing cancer treatment, one of their biggest concerns is the worry that the cancer may return some day, and wondering what to watch for. Here are some basic guidelines.
What is my follow up plan?

Refer to your personalized treatment summary and follow-up guidelines (Part 1 of the Follow-Up Care Plan). Your plan includes a schedule for your annual mammogram due date. It will tell you which health care provider to see for the follow up and who is responsible for booking your mammogram. The doctor ordering your mammogram will receive the results. If you do not receive a treatment summary/follow-up care plan from your cancer treatment team, please contact the CancerCare Manitoba Breast Cancer Centre of Hope and speak with the Breast Cancer Navigator who can assist you.
What can I expect at each visit?

In addition to routine medical tests and screening for your overall health, your family physician will ask if you have any concerns or changes since your last visit, and should examine your: breasts, chest, surgical scars, abdomen, lymph nodes in the armpit and collarbone areas, and the arm or hand of your affected side for swelling (lymphedema).

“What tests do I need after breast cancer?”

Who books the necessary tests and who provides the results?”

A yearly mammogram is recommended, typically in the same month every year. The date is chosen by your last mammogram which was
done at the time of your diagnosis. Example: If you were diagnosed in March with your mammogram then the next March will be your annual mammogram due date. Mammograms are not needed on a reconstructed breast. Please check with your family physician to ensure your mammogram has been scheduled well in advance of your annual due date.

Unless your family physician has specific concerns or you have symptoms that require further investigations, other tests such as x-rays, scans, blood work as well as tumor markers are not required on a routine basis.

Mammogram results go directly to the doctor who ordered the test. Each doctor has their own method of sharing these results with you; check with your doctor to see how your results will be shared with you.

“If I find a lump in my reconstructed breast, who do I go to?”

There is a small risk of having a cancer recurrence in a reconstructed breast. If you had breast reconstruction using your own tissue it is not uncommon to get “fat necrosis“ lumps. These are lumps of fat that had poor blood supply and have hardened. If you find a lump in your reconstructed breast, don’t panic. Call your plastic surgeon’s office to get it checked. Let your family physician know when you see him/her next.
“I have been started on anti-hormonal therapy. Why?”

Anti-hormonal therapy (Tamoxifen, Arimidex/Anastrozole, Femara/Letrozole, Aromasin/Exemestane) is offered to people with estrogen receptor (ER) and/or progesterone receptor (PR) positive breast cancer. This means the cancer is fed by the female hormone estrogen and progesterone. When you are pre-menopausal your ovaries make estrogen. When you are post-menopausal or have had your ovaries removed, your body makes estrogen by converting male hormones (androgens) into the female hormone estrogen. Anti-hormonal therapy blocks the hormones from affecting your cells or stops your body from making any estrogen. These medications are recommended for a minimum of five years to greatly reduce the risk of your breast cancer from coming back.

“I am on anti-hormonal therapy. What tests do I need and what should I watch for?”

For Tamoxifen:

All women on Tamoxifen should see their family physician promptly if they have any vaginal spotting or bleeding, abnormal discharge, or pelvic pain.

Tamoxifen is associated with an increased risk of early cataract formation. Have eye exams every one to two years and if problems arise. These eye exams are free if you are taking Tamoxifen. Tamoxifen can increase your risk of developing blood clots (deep vein thrombosis). Watch for pain, redness, or swelling in your legs or shortness of breath and seek medical attention immediately. When traveling, change your position and walk around frequently. Avoid crossing your legs when sitting.
Please note it is not safe to become pregnant while taking Tamoxifen. Discuss birth control with your doctor. Do not use any type of birth control that contains any hormones.

For Aromatase Inhibitors (Arimidex/Anastrozole, Femera/Letrozole, Aromasin/Exemestane):

Be sure to get 1200mg of calcium and 800-2000 IU of Vitamin D per day. Aim to get the majority of calcium through your diet and supplement as needed. Have a baseline Bone Mineral Density Scan (DEXA). If the scan is abnormal, discuss with your doctor the treatment options available. The bone density scan should be repeated every one to two years while taking an Aromatase Inhibitor.

Have your cholesterol and blood pressure monitored by your family physician as these medications may increase your cholesterol and blood pressure.

“Who writes the ongoing anti-hormonal therapy prescriptions?”

Anti-hormonal therapy medications are free and covered by the Home Cancer Drug Program. They must be prescribed by an oncologist initially and then your family physician will be able to write your ongoing prescriptions.
Reducing your risk of recurrence

Being fearful of recurrence is very very common for anyone who has been treated for cancer. Many wonder what they can do themselves to stop the cancer from coming back. While there are no guarantees, there are some things you can do that research has shown to reduce your risk of recurrence of breast cancer, or of developing another cancer, or a chronic illness.

No one knows more than you that there are some things in life that are not within our control. But healthy lifestyle behaviours have been shown to improve physical, emotional, social, and spiritual health over and over again, and those behaviours are something we can control!

Please see the sections in this book on diet and exercise for specific information on breast cancer. In Part 3 of this package called “Moving Forward After Cancer Treatment” which is also available on our website at www.movingforwardaftercancer.ca, you will find recommendations to help you stay healthy and information on resources to help you whether it is maintaining a healthy body weight, quitting smoking, exercising regularly, reducing your alcohol intake or eating a healthy diet. It also provides recommendation for sun safety to reduce your risk of skin cancer.

As the clever marketing ad says “Just do it!”. Start small, set realistic goals, and reach out for help.
“Can I have a baby after breast cancer? Is it safe?”

Many women consider pregnancy after their treatment for breast cancer. There are no studies to suggest that pregnancy increases a risk of breast cancer recurrence. Discuss this with your family physician or your oncologist. If you are not taking anti-hormonal therapy and are considering becoming pregnant, talk to your family doctor or oncologist to find out what timing might be right for you.

Please note it is not safe to become pregnant while taking Tamoxifen. Discuss non-hormonal forms of birth control with your doctor.

It is helpful to know that sometimes your menstrual cycle (periods) will stop during treatment. The younger you are, the more likely your periods will return following treatment. Alternatively, the older you are when your period stops due to cancer treatment, the more likely it will not return.

If you are having difficulty getting pregnant, as your doctor for a referral to the Heartland Fertility and Gynecology Clinic in Winnipeg at 204-779-8888.

**Fertile Future** – provides information on fertility, cancer, and financial assistance options for fertility treatments. [www.fertilefuture.ca](http://www.fertilefuture.ca).
“If I had breast cancer does that mean that my daughter will get it?”

Breast cancer is a common condition with a lifetime risk in women approaching one in nine (11%). Family history is only one of the known risk factors. Having a mother or sister who has had breast cancer increases a woman’s risk up to 20% (e.g. approximately double that of women in general population).

The general guideline for family members with a first degree relative (mother, sister or daughter) who has breast cancer, is to begin breast screening 10 years prior to the age of the person when they were diagnosed with breast cancer. e.g: if you were diagnosed at 53, then your daughter should start breast screening with mammograms by age 43. It is important for everyone to be aware of how their breasts look and feel. Know what changes to look for and see your family doctor if you notice:

- A new lump
- Puckering of the skin
- Change in the size, shape, and colour
- A change in the nipple
- New or bloody nipple discharge
- Thickened, hardened skin
“How do I know if my cancer was inherited?”

The possibility is small, only about 5-10% of all breast cancer is actually the result of a known inherited predisposition (gene mutation).

An inherited predisposition is suspected in individuals with a personal history of:

- breast cancer at a young age (35 years or younger) with or without a family history
- bilateral breast cancer (cancer in both breasts with the first diagnosis prior to age 50)
- both breast and ovarian cancer
- male breast cancer
- high grade serous ovarian cancer (with or without a family history of breast or ovarian cancer)
- breast cancer and Ashkenazi Jewish ancestry
- breast cancer at age of 50 or under and several family members diagnosed with breast and/or ovarian cancer
- breast cancer and a male blood relative with breast cancer
“What options are there for genetic testing?”

If you are worried that you may have an inherited predisposition (gene mutation) speak to your doctor or call the Hereditary Breast and Ovarian Cancer Clinic. Genetic testing for BRCA1 or BRCA2 gene mutations is offered to individuals and/or families who meet specific eligibility criteria based on personal/family history, ethnicity, and the availability of a blood sample from an affected family member. People qualifying for genetic testing will be counselled before testing occurs and after the results are known. Deciding whether to test or not is a personal decision.

“What if I am a BRCA1 or BRCA2 gene mutation carrier?”

If you carry a BRCA gene mutation, it does not mean you will develop breast and/or ovarian cancer. It means your risk is much higher than the average person. Women who inherit a BRCA1 or BRCA2 gene mutation have an estimated lifetime risk of 50-80% for developing breast cancer and 20-60% for ovarian cancer. Men who carry a BRCA2 gene mutation have an increased risk for developing breast cancer (10% compared to the general population risk of about 1%). BRCA1 or BRCA2 gene mutation carriers have a 50% chance of passing the gene mutation to their children.

“Is there a way to reduce my risk of getting another breast cancer and/or ovarian cancer if I am found to have a BRCA mutation?”

There are many considerations when deciding how to proceed once a BRCA mutation is found. Some choose to undergo careful
monitoring using mammograms and/or MRIs. Others consider surgeries like having both breasts removed (mastectomies) and both ovaries removed (oophorectomies) to lower their risk of developing either of these cancers. This is a personal decision and what is right for someone may not be right for someone else.

Do you have questions about genetic testing and hereditary cancer?

Resources you can contact:

**Hereditary Breast & Ovarian Cancer Clinic Genetic Counsellor**
204-787-8860

**CancerCare Manitoba Breast Cancer Centre of Hope**
204-788-8080 or 1-888-660-4866

**Hereditary Breast & Ovarian Cancer Foundation**
A Canadian organization that provides information on BRCA 1&2 gene mutations and information on risk reducing strategies including prophylactic mastectomy and oophorectomy.

Side Effects

We usually think of side effects as physical problems, but there is also an emotional and psychological impact from cancer and treatment.

You may (or may not) experience some of the following side effects after surgery and treatment for breast cancer. There may be other effects that you experience. Some of these problems can start immediately or can take months before appearing. Everyone’s experience is different.

Improvement of side effects may take time and you may need to work with your health care team to try various strategies, medications, or therapies. Some side effects will improve on their own with time, while others may go on for a significant period.

Take heart! If any of these side effects (or others not mentioned) are a problem or are affecting what you are doing day to day, there may be things that can be done to ease or get rid of them. Do not automatically think that they are just something you have to live with!

“Moving Forward After Breast Cancer” Information Session

These are sessions for breast cancer patients who have finished treatment. Information is provided by an oncology social worker and a breast cancer navigator on:

- Side effects from treatment such as fatigue and menopause
- Psychosocial and emotional issues
- Sexuality, reconnecting with your partner, dating
- Living with hope, uncertainty and fear of recurrence
• Lifestyle issues

• Getting back to work

• Role of your family physician

No cost to attend and family and friends are welcome. If you live outside of Winnipeg you may be able to join by MBTelehealth. For more information or to register call 204-788-8080 or 1-888-660-4866.

Fatigue

“I am so tired. Is this normal?”

Fatigue is the most common side effect left behind after treatment. It can be the most frustrating and life disrupting symptom. It can take a long time to regain your energy. It is not a sign of laziness and it is not the same “normal” tiredness that others experience. Please review the suggestions in the “Improving Fatigue and Sleep Problems” box in Part 3 of the Follow-Up Care Plan.

Sleep

“I am not sleeping well. Why and what can I do about it?”

Sleep problems can be related to fatigue but also can be from stress, change in activity levels, altered sleep patterns, or menopause. There are ways to improve “sleep hygiene”. Please review the suggestions in the “Improving Fatigue and Sleep Problems” box in Part 3 of the Follow-Up Care Plan.
Brain Fog

“I am so forgetful and I can’t seem to concentrate. Is this normal?”

“Cancer-related brain fog” is the name for a common problem following cancer treatment. This can include issues with memory, concentration, work finding, organization, and multi-tasking. The cause is unclear, but may be a result of the cancer itself, treatment, menopause, depression, anxiety, fatigue, and sleep issues.

You can try:

- Reducing stress
- Focusing on one thing at a time
- Puzzles and games which train memory and attention skills. The brain has the ability to develop new connections.
- Eating a well-balanced diet
- Improve sleep
- Exercise
- Attending the “Brain Fog” Education Program through CancerCare Manitoba
“Brain Fog” Education Program

In eight weekly sessions, people with cancer can learn how to improve their brain function. This program will help participants to:

- Understand more about the brain
- Learn about “neuro-plasticity”
- Learn and practice memory skills, task management skills, and more

Sessions are held in a group of eight to ten people through Patient and Family Support Services. If you live outside of Winnipeg you may be able to join by video conference through MBTelehealth. For information and to register, call: 204-787-2109 or toll free at 1-866-561-1026

Hair

“Will my hair grow back? Will it be the same?”

Your body takes three to four weeks after the last chemotherapy treatment before it starts to re-grow hair. Hair will start growing slowly and eventually will return to a normal rate – approximately ½ inch per month. It varies between people how quick you will have a full head of hair. When the hair re-grows it can be different to what you previously had – curly or straight or even gray! Initially, the hair is like baby hair and around the six month mark there is often a texture change to normal, adult hair. For this reason it is recommended to wait six months from the end of chemotherapy before colouring your hair as it may not tolerate dye well.

Growth of eye brows and lashes tends to be slower than your head hair. Some women find their face becomes fuzzy and requires waxing or sugaring. Note: sometimes the Aromatase Inhibitor anti-hormonal therapies can cause thinning of the hair.
Fingernails and Toenails

“My nails are not the same as before treatment. Is this normal?”

Treatment for breast cancer may cause changes to fingernails and toenails. Nails may be brittle, discoloured or have lines or bumpy ridges. Nails may become loose and fall off. This is not permanent and nails will re-grow. Lines will grow out of the nail. Keep nails trim and clean. Watch for signs of infections such as redness, swelling, pain, discharge and odour. See your family physician if signs of infection are present.

Neuropathies

“My hands and feet are numb or tingling; sometimes I can’t feel what I am holding. What is this?”

Some chemotherapy treatments, in particular Docetaxel/Taxotere, can cause peripheral neuropathies or nerve damage in the fingers/hands and toes/feet. This usually settles with time however there have been some patients who have ongoing issues. There may be treatment options available. Talk to your family physician or to the Breast Cancer Navigator at the CancerCare Manitoba Breast Cancer Centre of Hope.

Anti-Hormonal Therapy

“What are the side effects of anti-hormonal therapy?”

Side effects of anti-hormonal therapy often feel similar to menopause type symptoms because the goal of the treatment is to stop or block the hormones in your body. If you have side effects that are difficult to manage talk to your family physician or the Breast Cancer Navigator about them. Please do not stop taking your anti-hormonal therapy before speaking to your family physician. Anti-hormonal therapy...
is an important part of your treatment to reduce the risk of a cancer recurrence. There are often ways to help you manage any side effects.

“I am having difficulty with my medication to treat my hormone positive breast cancer. Is there anything to ease these side effects?”

Try changing the time of day that the medication is taken. Be sure to eat well (see Canada’s Food Guide), exercise, and do your best to get enough rest. Some women may need to change the medication they are on and this can depend on their menopausal status. If you have side effects that are difficult to manage talk to your family physician or the Breast Cancer Navigator about them.

Hot Flashes

“How do I manage menopause hot flashes?”

Chemotherapy, anti-hormonal therapy, surgical removal of ovaries, or stopping hormone replacement therapy when diagnosed with breast cancer leads to a sudden drop of the female hormones estrogen and progesterone. This can make the symptoms of menopause appear sudden, more severe and bothersome. Hormones are not recommended to treat them, but there are ways to help ease your symptoms.

• Venlafaxine (Effexor) is a prescription anti-depressant that is helpful. For those on Tamoxifen, Effexor is thought to be one of the safe choices of anti-depressants that your family physician can prescribe.

• Gapapentin is another drug that has been shown to be helpful.

• Clonidine is a blood pressure medication that can be an option for hot flashes.
Lymphedema

“What is Lymphedema?”

Lymphedema is a lifelong condition that can appear at any time after a surgery where lymph nodes are removed. Lymphedema occurs when there is a breakdown in the movement of lymph fluid within the body. Lymph fluid builds up and collects in an area and causes swelling that can be decreased with manual lymph drainage and compression bandaging. Lymphedema can be managed with proper care and a healthy lifestyle.

“What can cause Lymphedema?”

Breast cancer related Lymphedema can occur when sentinel and/or axillary lymph nodes and lymphatic vessels are damaged or removed during surgery. Other common causes are radiation therapy, cording or axillary web syndrome, trauma or injury, infection, malignant tumour, immobility and obesity.

“What are the signs and symptoms of Lymphedema?”

Breast cancer related lymphedema can affect the arm, hand, chest, armpit, and/or the trunk of your body. Signs and symptoms of Lymphedema may include:

- Swelling/fullness
- Heaviness
- Tightness
- Aching
- Feeling like your clothing or jewelry is becoming tighter on the side of your body you had surgery/treatment
See your family physician to report changes in size, color, temperature, skin condition, and sensation. Have an assessment of the new symptoms and get a referral to a certified lymphedema therapist for treatment.

**Infections (cellulitis)**

Infections can be an urgent medical situation. Signs may include redness, warmth, pain, chills/fever and a feeling of overall illness or flu-like symptoms.

See your family physician if you notice any of these signs or symptoms.

**“How can I reduce my risk of developing lymphedema?”**

It is not known why some people with the same risk factors develop Lymphedema and others do not. Here are some practical suggestions that will reduce the risk of developing Lymphedema and precautions to consider if it does appear.

- **Skin care:** Avoid trauma/injury to reduce the risk of infection. Clean small breaks in the skin with soap and water and apply antibiotic cream. Serious cuts should be seen by a doctor. Pay attention to nail care: avoid cutting your cuticles to reduce the risk of infection. Keep your arm clean and dry and apply unscented moisturizer daily. Protect exposed skin with sunscreen and insect repellent when outside. Wear gloves when gardening or cleaning.

- **Avoid arm constriction (anything that would cause the arm to be squeezed):** Whenever possible, use an uninvolved or not-at-risk arm for blood pressures, blood work, and intravenouses (I.V.). Do not wear tight-fitting jewelry or clothing. Do wear a supportive, properly fitted bra with no underwire.
• **Activity/lifestyle:** Maintain a healthy body weight by following a well-balanced diet and exercising. Gradually build up the duration and intensity of exercise. Take frequent rest periods during activity. Limit repetitive motions (rubbing, scrubbing, pulling, or pushing). Avoid heavy lifting with your arm. Consult your family physician before starting an exercise program. More information about exercises and Lymphedema can be found in the “Exercise and Activity” section of this booklet.

• **Temperature extremes:** Avoid exposure to extreme heat or cold that can cause tissue damage (burns or frostbite). Limit prolonged exposure to topical heat and cold, which may include hot/cold packs, hot tubs, saunas, steam rooms, and sweat lodges.

**WRHA Breast Health Centre – Lymphedema Program**

The WRHA Breast Health Centre provides treatment and management of upper body Lymphedema as a result of breast cancer at no charge. A physician’s referral is required for an appointment. If you have any questions you can contact a Certified Lymphedema Therapist at the centre.

204-235-3684 or 204-237-2034

Toll Free: 1-888-501-5219

**Pain**

“I have pain or a funny sensation in my breast, armpit or back of my arm. What is this and will it improve?”

It is common for women to experience post-operative pain in the breast, in the armpit or down along the back of the arm. This can occur soon after surgery or any time down the road. It can feel snappy, burning,
twinge-like and overly sensitive. It can improve over time or for some it may never go away. This is related to the breast or lymph node surgery and is not related to the cancer itself.

Arm Movement

“I have trouble raising my arm. What can I do about it?”

See your family physician for an assessment and a referral to either a physiotherapist or certified Lymphedema therapist. Physiotherapy and myofascia release are treatments that can be used to help with this.

Scar Tissue

“My mastectomy scar is tight and tender. What can I do?”

Scar tissue forms as part of the healing process after a skin injury (surgery/radiation). If scar tissue is causing stiffness, pressure or pain, ask your doctor if physical therapy could help. Some people use creams, ointments or gels to fade or lighten scars. Gentle massage and touching the sensitive area may help. Some complementary techniques have been shown to ease pain.

Pain and Symptom Clinic

Following breast cancer and its treatment, some people experience symptoms that may be difficult to manage. If you have difficulty controlling your pain, you can ask your doctor to refer you to the CancerCare Manitoba Pain and Symptom Management Clinic.
“I had a mastectomy. What are my options?”

Women can choose to wear a breast prosthesis or have breast reconstruction surgery.

The Manitoba Breast Prosthesis Program is available for Manitoba women who have had a mastectomy or surgical procedure resulting in a significant loss of breast tissue. Prostheses come in different styles, sizes, and shapes. Some can be worn in a brassiere with a pocket while others can stick directly on to the skin. It is important that your skin and chest have had time to heal from surgery, radiation, or any other treatment you may have experienced before wearing a brassiere and prosthesis. When you do start wearing a brassiere and prosthesis do so for a short amount of time and gradually increase the amount of wearing time so you can get used to it. The Manitoba Breast Prosthesis Program brochure is available on the CancerCare Manitoba website or contact the CancerCare Manitoba Breast Cancer Centre of Hope for information.

“I had a lumpectomy and my breast is noticeably smaller. Is there a prosthesis for this?”

There are breast prostheses available for women who have had a lumpectomy resulting in a significant loss of breast tissue. They are called “balance” prostheses which are specifically designed for this purpose. Plastic surgery may also be an option for you. Ask your family physician for a referral to the plastic surgeon to discuss options if this interests you.

Breast Prostheses and Bras

For information on prosthesis, bras, listings of fitters and suppliers, and benefits available through the Manitoba Breast Prosthesis Program, call the CancerCare Manitoba Breast Cancer Centre of Hope at 204-788-8080 or 1-888-660-4866. You can also visit: http://www.cancercare.mb.ca/home/patients_and_family/patient_and_family_support_services/manitoba_breast_prosthesis_program/
“How does reconstruction work if I didn’t choose to do it when I was diagnosed?”

Many patients choose to postpone considering breast reconstruction until after they have completed their cancer treatments. Get a referral from your family physician to see a plastic surgeon as soon as possible. It may take a while to be seen which will give you time to learn more about breast reconstruction options. Not all options are available from every plastic surgeon. Speak with the Breast Cancer Navigator at the CancerCare Manitoba Breast Cancer Centre of Hope about the reconstruction options available while you wait for an appointment.

Breast Reconstruction Information Session

Topics include:

• Types of reconstruction
• Getting ready for surgery and recovery
• Your hospital stay
• Support services
• Hear from someone who has had breast reconstruction

Location: Breast Cancer Centre of Hope – 691 Wolseley Avenue

To register call: 204-788-8080 or 1-888-660-4866

For more information on the Breast Reconstruction Program at Health Sciences Centre in Winnipeg, you can visit: www.breastreconstructionprogram.com
“I am having difficulty accepting how my breast(s) look and feel – how can I get through this and feel better about it/them?”

Women are often upset about what their breast(s) look like after surgery – the scars and different shape after surgery can be surprising and make them feel less feminine. Many women also experience changes in sensation – including numbness, heightened sensitivity, sharp sensations like an electric shock and the breast(s) may also not respond like before. This can be upsetting. It can take time and a lot of reassurance from the woman’s partner for her to accept the new reality of her altered breast(s). Women also tend to judge themselves harshly and hold themselves to a high standard (often influenced by media messages). While loving words from her partner can help, ultimately it is the woman who needs to come to a place of acceptance and this can take a long time. It may take time and patience to become accustomed to the changes and to regain comfort with your body. Take good care of yourself and engage in activities that make you feel good, such as exercise, dance, or massage. Slowly become more familiar with your “new” body by looking at it directly or in a mirror, touching it, and learning what feels “normal”.

“I feel like less of a woman after the surgery – what can I do to feel like I used to about myself?”

It is common to feel less feminine after surgery to remove one or both breasts – after all, our breasts are one of the outward symbols of being a woman. However, what really defines you as a woman is your brain and heart, and how others think of you, as well as the roles that you play in your family, friendships, work, etc. Those who love you and who value your place in their lives don’t think of you as any less of a woman. In fact, the opposite may be true – you are a survivor who has managed to get over so many challenges.

It’s also important to talk to your health care providers about whether
these feelings might be depression which is common among cancer survivors and can be treated. If you think you may be depressed, talk to your family physician or call CancerCare Manitoba Patient and Family Support Services for an appointment with one of the counsellors.

“I find it difficult to undress in front of my partner – what can I do to change this or will I always feel this way?”

Our partners tend to love us regardless of what we look like naked – as we love them despite the changes in their bodies over time. When we deny our partner the opportunity to see us semi-clothed or naked, we deny them an important and pleasurable sensual experience and they miss that. This is something that you can approach in baby steps – darkened room, some covering of the parts you don’t want to show initially and then a slow reveal...just talk about what you are feeling and let your partner tell you what he/she is thinking and appreciating. You may find strength and courage in his/her words.

“I have no desire to be sexual anymore – is this normal and when will it get better?”

There are a number of reasons why sexual desire goes away during/after cancer treatment. It is very common and normal – and it may get better – but why wait and wait? Make an appointment to see a sexuality counsellor and get some help!

Help for Intimacy & Sexuality Problems

An expert nurse counsellor is available at CancerCare Manitoba to meet with you and/or your partner to talk about any concerns you have about sexuality, and help you renew your sex life after cancer. To make an appointment with the sexuality counsellor, call: 204-787-4495 or 1-866-561-1026 ext. 4495
“How can I get my interest in intimacy and sexuality back?”

You may feel like your body is less attractive, or you may have less sensitivity to arousal. Sometimes people feel less “connected” to their body after having many health care providers examine them so often. Or your partner may be worried about hurting you. Start with lots of closeness and make a “date” to become intimate. Ensure you communicate your needs and concerns to your partner.

“I find that sexual touching of my genitals is unpleasant – why is this happening and is there anything to make the pain go away?”

This may be happening for all sorts of reasons including hormonal changes, anxiety, side effects of chemotherapy etc. Finding help for this depends on the reason for the “unpleasant” feeling. Consult your primary care provider to rule out any infection and to identify the source of the problem. Seeing a sexuality counsellor may also be helpful.

“What are my options for vaginal dryness?”

With breast cancer, no hormonal products are recommended for vaginal dryness (only in extreme cases). Vaginal dryness is a result of a lack of estrogen and this can lead to inflammation of the tissues and a general discomfort. Products like Replens or Liquibeads can help restore vaginal moisture and elasticity. It is recommended for use every three days for three to four weeks to help heal and restore the vaginal tissues. You may experience a bit of burning if your tissues are quite “raw” but this should settle. If this does not help, see your doctor. These products are not intended to be used just prior to intercourse. Products like Astroglide or K-Y Intrigue are recommended for intercourse. It mimics natural body fluids and works as both a lubricant and a moisturizer. Scented or flavoured products may increase irritation. Refer to the menopause pamphlet from the CancerCare Manitoba Breast Cancer Centre of Hope.
Experiencing a breast cancer diagnosis and treatment can be a traumatic life event. Women may be affected in many ways including spiritually, emotionally, psychologically, physically, and practically. Professional support is available to patients and families free of charge and without a referral, even after being discharged from the cancer clinic.

Patient and Family Support Services

Patient and Family Counselling

Cancer affects not only the physical body, but also the emotional, social, and spiritual needs of a person and their family or loved ones.

- Many individuals and families have found it helpful to talk to a professional counsellor.

- The counsellors at CancerCare Manitoba have experience, training, and knowledge to help you and your family cope with cancer and its treatments.

- A counsellor can meet with you on your own, or together with you and your family. Family and loved ones are also welcome to meet on their own.

Spiritual Health

You may wish to speak with our Spiritual Health Specialist (204-787-4124). Spiritual care is available to people from all backgrounds whether or not they are from a spiritual/religious tradition. Counselling is available by telephone and by video conference through MBTelehealth.

For support groups and programs, go to: www.cancercare.mb.ca under Patient and Family, click Current Program Listing.
“I worry about the cancer coming back - particularly when I have aches or pains. What will help?”

Many people worry about the cancer returning – the good news is the worry usually lessons over time.

- Practice a healthy lifestyle (physical, psychological, emotional, and spiritual)
- Maintain a good relationship with your health care provider
- Maintain a sense of hope, optimism, and humor
- Seek support from family, friends, support programs, and professionals
- Stay up to date on breast cancer resources

“I think I may be depressed. Is this normal? Why now?”

Many women feel sad, fatigued, scared, angry, or overwhelmed after treatment. Some develop depression. Ensure you talk with your doctor about how you are feeling. Many people benefit from counselling and/or medication. Getting adequate sleep, activity, and social interaction can be helpful. Ironically the same things you don’t feel like doing when you are down are actually the things that help manage depressed mood.
Emotional and Psychological Impact of Cancer and Treatment

Make sure you let someone close to you know how you are feeling and consider counselling through Patient and Family Support Services. If you have any thoughts about harming yourself or anyone else, call the crisis line at 204-786-8686, call 911 or go to the nearest emergency room immediately.

“I’m feeling anxious. Is this common?”

It is very common to experience increased anxiety during and after treatment as you cope with many life changes, decisions, and challenges. Counselling and/or a combination of medication and counselling have shown to be very effective for helping with anxiety. Strategies known to be helpful include:

- Learn what triggers your anxiety and what helps you relax
- Talk to your family physician about your concerns
- Seek support from family, friends, spiritual, religious groups, support groups, and counsellors
- Practice mind/body activities such as breathing techniques, restorative yoga, meditation, guided imagery, soothing music, and mindfulness.

“Did stress cause my cancer?”

We really do not know what causes breast cancer. Medical researchers are still exploring the relationship between stress and the function of the immune system.

Stress is a normal part of life and can occur during both difficult and joyous times. Stress can never be eliminated, but reducing it will likely help you feel calmer and more in control of your life which will lead to a greater sense of health, well being, and happiness.
“My family and friends think I should be “over it” by now, but I’m not. Is this normal?”

People don’t often know what to expect once treatment is over and just want you to be well. It may take much longer than everyone expects. Let others know how you are feeling and what you need.

“I have noticed some of my relationships have changed. What can I do?”

It is very common to find some relationships may have deepened while others are less close. You may feel hurt or disappointed in some people and pleasantly surprised by others. Consider letting others know how you feel, or perhaps it is enough to know they did their best they could.

“Now that I am feeling better my family seems to be struggling. Is this normal?”

Now that your family can be less worried about you they may need time to deal with their own feelings. Counselling is available to your close friends and family.
“When should I return to work?”

It is normal to need time following treatment to recover psychologically and physically. Communicate with your healthcare team and workplace/disability provider to determine the right timing for you. A gradual return to work may be recommended. Patient and Family Support Services offer many supports and programs to aid in your recovery.

Finding your “new normal”…

After putting a lot of energy into treatment and healing some people find it difficult to adjust to life after cancer treatment.

Your family and friends may be expecting you to be back to your old self. They are likely looking forward to life returning to normal. The reality is that things have likely changed for you. You may feel different or look at life differently than you did before cancer. This can be confusing and frustrating for everyone involved.

The completion of treatment is often a time when people begin to recognize the emotional impact of the cancer experience. This may be the first time you have actually had the energy to process what you have just been through. This may be a good time to seek additional support from other cancer survivors or supportive care professional counselling.

It will likely take time for you and your family and friends to discover your new normal. Give yourself permission to ask for help. Try your best to be honest with people about how you are feeling and don’t forget to be patient and kind to yourself.

Support Groups

Professionally led face-to-face and online support groups provide an environment for those living with cancer with an opportunity to interact with others in similar situations.
Cancercare Manitoba - Breast Cancer Support Groups:

• Breast Cancer Support Group (for women who have been treated for primary breast cancer) 204-787-4645

• Younger Women with Breast Cancer 204-787-1325

Online Support Groups:

• Cancer Chat Canada – professionally facilitated on-line support groups for people affected by cancer www.cancerchatcanada.ca

• Couplelinks – a professionally facilitated on-line workshop for couples affected by breast cancer www.couplelinks.ca

For information on breast cancer support groups in your community call Cancercare Manitoba Breast Cancer Centre of Hope at 1-888-660-4866.

Peer Support

It can be helpful to talk with someone who has also had breast cancer and finished treatment. A Peer Support Program can offer a match with a trained volunteer who has had a similar experience with breast cancer. All information is confidential. Volunteers do not provide medical advice or counselling. Peer support is offered by phone or in person. To arrange to talk with a peer support volunteer call:

Cancercare Manitoba Breast Cancer Centre of Hope Peer Support Program: 204-788-8080 or 1-888-660-4866

Canadian Cancer Society CancerConnections: 204-786-0616 or 1-800-263-6750
Expressive Arts Group for People with Cancer:

A CancerCare Manitoba Patient and Family Support Services program for people who have been treated with any type of cancer in the past two years. Use creativity and art making in supportive group therapy to explore your cancer experience. For information and to register call 204-787-2109.

Mindfulness Practice:

A CancerCare Manitoba Patient and Family Support Services eight week program for people living with cancer and their families interested in mindfulness. For information and to register call 204-787-4122.

In addition to breast cancer support groups and programs listed there are many other programs and groups for all types of cancer available through CancerCare Manitoba Patient and Family Support Services.

To find information on other programs and group sessions check:

• Navigator newsletter
• CancerCare Manitoba website www.cancercare.mb.ca
• Call CancerCare Manitoba, Patient and Family Support Services at 204-787-2109 or 1-866-561-1026 ext 2109 and ask to speak to a counsellor who can help you sort out which programs may be the best fit for you.

All CancerCare Manitoba Patient and Family Support Services programs are offered at no cost to the participants.
After Treatment Programs:

• “Eat Well. Get Fit. Live Well.” is a free education group for people struggling with physical activity, healthy eating, and weight changes after breast cancer treatments. Get empowered and educated about changes you can introduce to improve your health through eight weekly sessions. For information and registration please call the WRHA Breast Health Centre at 204-235-3646.

• “Cancer Transitions Program” is an eight week program offered in collaboration with the Reh-Fit Centre on Taylor Avenue. It is designed to help cancer survivors who have completed treatment within the last two years transition from active treatment to life after treatment. Weekly sessions include nutrition, emotional health and well being, and what to expect in follow up care. Each session includes exercise twice a week at your own pace.

For more information and to register, call CancerCare Manitoba Patient and Family Support Services at 204-787-2109 or 1-866-561-1026 extension 2109

• “Get Better Together” is a free six week workshop designed to help Manitobans with ongoing health conditions take control of their health. Topics include healthy eating, communication, physical activity, and pain management. Supported by Manitoba Health and Regional Health Authorities. To register, call 204-632-3927.
“How much calcium do I need?”

Osteoporosis Canada recommends 1000mg/day of calcium for adults less than 50 years of age. While the recommendation for adults 50 years of age and older is 1200mg/day. You are encouraged to obtain your calcium through diet if possible. If you are not getting enough, a calcium supplement may be indicated.

“How much Vitamin D do I need?”

Osteoporosis Canada recommends adults under 50 years of age take 400-1000 IU/day of supplemental vitamin D daily. For adults who are 50 years of age and over, the recommendation is to take 800-2000 IU/day. Osteoporosis Canada recommends Canadian adults get their vitamin D through supplementation year round. This is because it is not possible to get enough through diet alone and many things can interfere with the production of vitamin D from the sun.

If you are taking a multivitamin, check the label for the amount of vitamin D and calcium it contains. For further information, contact your health care provider or registered dietitian.

Calculate the calcium intake in your diet at:
www.osteoporosis.ca/osteoporosis-and-you/nutrition/

Bone Health After Breast Cancer

A free education session for those who have had breast cancer and want to reduce their risk of developing osteoporosis. Facilitators including a physiotherapist, clinical dietitian, and pharmacist discuss:
• What osteoporosis is and how to reduce your risk

• Recommendations for calcium and vitamin D and how to meet them

• What role supplements have and how to choose them

• Exercises to promote strong bones

• How osteoporosis is diagnosed and how it is treated

To register call the WRHA Breast Health Centre at 204-235-3646.

“Do I need to follow a low fat diet?”

The findings of the studies on fat intake and survival after the diagnosis of breast cancer have been inconsistent. A large clinical trial suggested that low fat diets may reduce the risk of recurrence especially for women with ER negative disease. The group also lost weight so it is uncertain what contributed to the reduced risk – the low fat intake or the weight loss. Meanwhile we do know there is benefit for the heart by following a low fat diet.

“Can I eat soy food?”

Soy beans like other legumes are an excellent source of protein. With earlier research there was concern about having soy because of its plant estrogen content. In these studies, the plant estrogen part only was studied, not the soy food. In more recent research, it has now been shown that breast cancer survivors can safely eat soy foods as part of a healthy diet, even while taking Tamoxifen. That may be because soy foods have cancer protective properties. Soy supplements should be avoided since their safety as related to breast cancer has not been studied. Check with your health care provider if you are taking an Aromatase Inhibitor for the most current information on whether soy foods need to be restricted.
“Can I add flaxseed to my diet?”

Flaxseed is a good source of fibre and omega 3 fat and can be part of a healthy diet. By grinding it, the body is better able to digest it. Like soy foods, ground flaxseeds contain plant estrogens. With our current knowledge, flaxseed appears safe to have, even if you have had breast cancer, when it is used in moderation (one to two tablespoons a day) as part of a healthy diet.

“Should I avoid milk products because they contain estrogen?”

Milk and milk products are an important part of a healthy diet. The good news is that in Canada, hormones are not given to dairy cattle. Therefore, milk does not contain a significant amount of hormones.

“Does alcohol increase the risk of breast cancer recurrence?”

Based on the best available evidence, it appears that up to approximately one alcoholic drink per day on average for women may be safe to have. A serving size (10g alcohol) is 12 fluid ounces (360ml) of regular beer, 5 fluid ounces (150ml) wine, and 1.5 ounces (45ml) spirits.

“What about growth hormones in meat?”

Growth hormones are not approved for use in Canada in chickens or pigs or added to their feed. However, hormones may be used in beef cattle. One of the growth hormones used is a form of estrogen that occurs naturally in animals and humans. By choosing leaner cuts of meat and trimming visible fat, the intake of residues can be reduced since they are thought to be stored in the fat part of the meat. People are encouraged to have a variety of meat and meat substitutes including chicken, fish, legumes, eggs, nuts, and nut butter.
“I need to lose weight. What can I do?”

Achieving or maintaining a healthy weight may be one of the most important things you can do as a breast cancer survivor. Experts agree the best way to lose weight is to eat less and move more. You will be more successful by making gradual, simple changes in the way you eat, as well as increasing your level of physical activity.

For more recommendations and information about maintaining a healthy body weight and eating well, please refer to the Moving Forward After Cancer Treatment Part 3 booklet and Canada’s Food Guide.

Try this simple four step approach to weight loss:

1. Eat less higher calorie foods and foods that are very concentrated in calories. Include more vegetables, fruit, whole grains, and legumes (dried beans, peas, and lentils) in your diet.
2. Cut back on portion sizes.
3. Be mindful or aware when, how much, and what you are eating.
4. Get regular physical activity. Slowly increase your level of activity over time, and try out different activities until you find something that you enjoy.

Talk to a dietitian

Breast cancer survivors may have specific concerns with their diet, nutrition, and eating. If you have difficulty eating a healthy diet, weight management, or if you have questions about nutrition, make an appointment with a registered dietitian at WRHA Breast Health Centre at 204-235-3646 or toll free at 1-888-501-5219.

Further information available at:

www.dietitians.ca
www.eatrightontario.ca
Being active after treatment for breast cancer is important whether you are getting back to activities you enjoy or starting a new healthy lifestyle plan. Research has shown a link between exercise and decreased rates of recurrence and increased rates of survival in breast cancer. Exercise can also combat the side effects of fatigue, sleep disturbances, depression, anxiety, and reduce the risk of Lymphedema. It can also help you maintain and reach a healthy weight. Always check with your doctor before starting an exercise program.

“When can I start exercising?”

Right away! Please check with your physician or surgeon prior to starting an exercise program, to know if there are certain types of exercises that should be avoided. If you were given exercises from your surgeon, continue to build in a slow progressive way.

“What should I do to start?”

If you were not active during your treatment, it is important to focus on overall fitness (cardio, flexibility, and strength) at the beginning and slowly increase your activity level. You can start with just five minutes a day, with activities, such as walking, swimming, bicycling, mild guided exercise or even dancing in your kitchen! Try to build up to 30 minutes of light, uninterrupted activity. This may take weeks to months. You are also using this time to see how your body reacts to exercise, paying particular attention to the arm where you had lymph nodes removed or radiation treatment. This is in addition to any rehab exercises you were given after your surgery.

Strength training and more vigorous exercises can be attempted once you have build up some general fitness. If you want to focus on building strength in your affected arm and you have had issues with Lymphedema, it is recommended that in the beginning you work with a physiotherapist, occupational therapist, athletic therapist, or an exercise specialist who is aware of lymphedema. Slow, steady, and progressive exercise is recommended to avoid lymphedema flare-ups.
“What can’t I do?”

Avoid sudden increases in activity level, endurance activities or strength training. All exercise should start easy and build slowly and progressively. If you have concerns with lymphedema, you should wear a compression sleeve while exercising, and avoid hot, humid, conditions. Notice that there are no activities listed should be avoided – the key is to use common sense and build up your activity in a safe, slow, and progressive way.

“Someone told me that I am not allowed to lift more than 10 pounds with the arm on my surgery side. Is that true?”

That is an older recommendation based on trying to avoid lymphedema. The latest recommendations for breast cancer patients indicates a gradual, slow, progressive building of strength in the arm where lymph node damage or removal has occurred, may help reduce the risk of lymphedema. If lymphedema is a concern, see a lymphedema therapist and start your strength training under the guidance of a physiotherapist, occupational therapist, or athletic therapist, and wear a compression sleeve. The reasoning is that a strong arm is better able to withstand stress and injury which can trigger a lymphedema flare-up. Movement and exercise also improves the “pump” for your lymphatic system, allowing for better drainage.

“Can I do hot yoga?”

If you have increased risk factors for lymphedema, or if you are diagnosed with lymphedema, it is recommended to avoid hot yoga classes. There are many options out there for activity and fitness that you can explore that will not have the same risk of developing or worsening lymphedema. Discuss your plans with your family practitioner before starting any activity.
Exercise Precautions Following Breast Cancer Treatment

Following treatment, you may need to take special precautions. Below are some to be aware of:

Low bone density

If you have low bone density, weight bearing exercise, such as walking, is recommended to help build bone density. Any vigorous exercise that involves jumping, hopping, running, or high impact activities should be avoided, as these can lead to a bone fracture.

Cardiovascular issues and heart problems

If you have cardiovascular issues or heart problems related to cancer or not, a proper medical assessment should be done before you start any physical activity program.

Taking pain medication or anti-inflammatory medications

If you are taking either of these types of medications, be careful not to “over-do-it” and take care of any injuries immediately. These types of medications may hide or “mask” the pain and there is a risk of pushing yourself too far.

Recently had surgery

If you have recently had surgery, discuss exercise with your surgeon to make sure you are safe to start.

Poor flexibility and/or shoulder pain

If you are having continued issues with your shoulder, such as poor flexibility, frozen shoulder, or shoulder pain, make sure to see a physiotherapist or occupational therapist to properly evaluate and rehabilitate your arm.
Extreme fatigue, anemia, or peripheral neuropathy

If you are having extreme fatigue, anemia, or peripheral neuropathy, talk to your family physician about exercise and get their recommendations for activity. Make sure to tell your physiotherapist, occupational therapist, or exercise specialist about these concerns.

You may need a physician's referral to access services of a physiotherapist, occupational therapist, or athletic therapist. For individual assessment, you may want to contact:

**MB PHYSIOTHERAPY ASSOCIATION**
204-925-5701 or 1-877-925-5701
www.mbphysio.org

**MB SOCIETY OF OCCUPATIONAL THERAPISTS**

Cancer specific exercise programs

“Pilates and Cancer” is a free eight week program for women who have completed treatment for any type of cancer within the last 12 months. For information call 204-787-2109 or toll free at 1-866-561-1026 extension 2109.

“Yoga and Cancer” is a free program for patients on treatment or finished treatment within the past year. For information call 204-787-2109 or toll free at 1-866-561-1026 extension 2109.

The programs listed below may be free or charge a fee to attend.

Cancer Management Exercise Program – Rady Jewish Community Centre Ph: 204-477-7510

Dragon Boat Teams – non profit organization of breast cancer survivors that participate in the sport of dragon boat racing.

• In Winnipeg – Chemo Savvy Ph: 204-788-8080 or visit www.chemosavvy.ca
• In Brandon – Waves of Hope Ph: 1-888-660-4866

Also refer to the After Treatment Programs mentioned earlier on pg. 39:

• Eat Well. Get Fit. Live Well
• Cancer Transitions
Breast Cancer Centre of Hope

Finished treatment? Looking for information on breast cancer?

The Breast Cancer Centre of Hope offers information and support to help with understanding breast cancer, making treatment decisions, moving forward after treatment, and finding resources.

- Talk with our Breast Cancer Navigator
- Attend education sessions
- Use our lending library
- Speak to a volunteer who has had a similar breast cancer experience (Peer Support)

Appointments are recommended to talk with the Breast Cancer Navigator.

Are you from rural or northern Manitoba?

Call us and we can mail information to you. We can also connect you with a community contact volunteer close to home, and/or a cancer nurse navigator in your health region.

Located at:
691 Wolseley Avenue
(across from the Misericordia Health Centre)

Phone:
204-788-8080 or toll free at 1-888-660-4866
Cancer Navigation can guide and support you and your families through the entire cancer journey. Cancer Navigation Services provide information and support for patients and families in a timely manner, helping to reduce distress and anxiety. Cancer Navigation Services consist of Nurse Navigators and a Psychosocial Oncology Clinician.

**What are Nurse Navigators?**

The Navigators are Registered Nurses with specialized training in cancer care and navigation. They work closely with your health care team to coordinate your care and help you access resources, referrals, and other supports.

**How can Navigation help?**

Facilitate timely and appropriate access to the cancer care system

- Access the resources and services you need
- Connect you with psychosocial, financial and educational resources
- Prepare you for consultations and treatments
- Link you to resources you may need after your treatments
- Listen to your needs, and assist you to find answers to your questions and concerns

**What are Psychosocial Oncology Clinicians?**

Professionally trained counsellors who can help you and your family cope emotionally, socially, spiritually and practically with cancer. They help find transportation and accommodations, link patients with peer support, and help build skills to cope with normal distress.
How to contact Navigation Services

Your family doctor, nurse, or any other health care professional can refer you to the nurse navigators.

Patients and families can also contact the nurse navigator directly for more information about a cancer diagnosis, treatment or follow up care:

- **Eriksdale**: 1-204-739-4457
- **Selkirk**: 1-204-785-9576 or 1-855-557-2273
- **Brandon**: 1-204-578-2206
- **Swan River**: 1-855-346-3710
- **Deloraine**: 1-855-346-3710
- **Dauphin**: 1-855-346-3710
- **Portage la Prairie**: 1-855-623-1533
- **Morden**: 1-855-623-1533

MBTelehealth for Rural Patients

MBTelehealth is a hospital-based service that provides “live” video conferencing between two or more sites. Rural patients can attend presentations, programs, educational events, meetings or one-on-one counselling sessions that are being broadcast from another site in Manitoba. Patients can view the speaker or site, see presentation slides or pictures if they are being used, and have the ability to ask questions or be part of the discussions. Sites are based out of hospitals and health care facilities throughout the province, and if available, will be booked by your primary health care team.
Community Contact Program
Volunteers living in communities across Manitoba can provide information on cancer related programs and resources. For information on your community, call the CancerCare Manitoba Breast Cancer Centre of Hope at 204-788-8080 or 1-888-660-4866.

First Nations, Metis and Inuit Cancer Control
Patient Access Coordinator    Toll Free: 1-855-881-4395

Call if you need assistance with:

• Questions

• Concerns about your follow up plan

• Problem-solving with FNIHB (First Nations and Inuit Health Branch)

• What are you supposed to do next?

• Links with interpreters, spiritual/cultural care and advocacy
Support Services and Resources

Information on services and programs not listed below are included by topic in the previous sections. (refer to the Table of Contents for topics)

Winnipeg Regional Health Authority Breast Health Centre

204-235-3906 or toll free 1-888-501-5219

100-400 Tache Avenue (across from St. Boniface General Hospital)

www.wrha.mb.ca/bhc

The Breast Health Centre focuses on services for women and men throughout Manitoba with:

- Breast health concerns
- Signs and symptoms of breast cancer
- Outcomes for surgery

The Centre provides patients with a breast diagnosis through the diagnostic imaging department, surgical treatment options through a surgical consultation, and treatment of lymphedema and cording/mobility concerns through the lymphedema clinic. The comprehensive clinic also provides clinical breast exams, nutritional services, psychosocial counselling and patient education and support sessions through a variety of specialized programs. The Centre refers patients for genetic counseling and testing.

Referrals and self referrals are accepted. Please contact the Centre, or visit the website for more information.

The Navigator

A monthly newsletter and calendar of cancer related services, support groups, information sessions, and other programs. For a copy of The Navigator, call 204-788-8080 or toll free at 1-888-660-4866.

To view or print online go to www.cancercare.mb.ca under the Patient and Family section.

Websites

It is important to have up to date, reliable information. These are recommended websites:

CANADIAN WEBSITES

CANADIAN BREAST CANCER NETWORK www.cbcn.ca

Specialized information for rural women, young women, metastatic cancer, and survivorship issues.

BC CANCER AGENCY www.bccancer.ca

Information on treatment and survivorship.
WOMEN’S HEALTH www.breastcancernowwhat.ca

RETHINK BREAST CANCER www.rethinkbreastcancer.com

Support, information, and resources for young women with breast cancer.

WILLOW BREAST CANCER SUPPORT CANADA www.willow.org

Provides free, survivor-driven support and information and programs to anyone affected by breast cancer.

YOUNG ADULT CANCER CANADA www.youngadultcancer.ca

For young people with any type of cancer. Includes videos on various issues, online profiles, articles written by young survivors, and information on their annual retreat.

OUTSIDE OF CANADA:

LIVING BEYOND BREAST CANCER www.lbbc.com

Information about breast cancer issues, discussion boards, and teleconferences.

BREASTCANCER.ORG www.breastcancer.org

A non-profit organization that provides information on diagnosis, treatment, side effects, and survivorship.

YOUNG SURVIVAL COALITION www.youngsurvival.org

Young women facing breast cancer together.

AMERICAN SOCIETY OF CLINICAL ONCOLOGY www.cancer.net

Provides treatment guidelines based on research from around the world.
