UNDERSTANDING THE NEW SCREENING GUIDELINES FOR CERVICAL CANCER

CervixCheck has updated guidelines for cervical cancer screening in Manitoba. Changes have been made to the recommendations for screening initiation and the screening interval, and aim to maximize the benefits of screening while minimizing the harms.

Screening Initiation

<table>
<thead>
<tr>
<th>RECOMMENDATION</th>
<th>RATIONALE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Screening should be initiated at 21 years of age for all women who have ever been sexually active. Health care providers should discuss the benefits and harms of screening with their patients.</td>
<td>The harms of screening women under 21 years of age outweigh the benefits. • Pap tests and follow-up procedures expose young women to anxiety and harms including reduced reproductive performance (preterm delivery, low birth weight, increased caesarean section rate, and premature rupturing of membranes).• Cervical cancer in young women is very rare. Since 1980, 0.18% of invasive cervical cancers in Manitoba were diagnosed in women under 21. Evidence suggests that these cancers would not have been detected by screening. • Most cytological abnormalities in young women are low-grade and non-oncogenic. 90% will spontaneously regress within 24 months. • The latency period between HPV infection and the development of precancerous lesions and invasive cervical cancer is approximately 7 to 10 years. Delaying the start of screening in young women still provides the opportunity to detect and treat lesions. Although the Canadian Task Force on Preventive Health Care recommends not routinely screening women aged 20-24, a “weak recommendation” is assigned due to the uncertainty of the evidence. Screening may still be minimally effective to reduce cervical cancer incidence in this age group. Initiating screening at 21 years of age is consistent with the recommendation made in most other Canadian provinces and territories, and is also the recommendation made by the U.S. Preventive Services Task Force. CervixCheck will continue to respond to the evolving evidence to support screening guidelines. Some sexually active women may choose to delay onset of screening until 25 years of age. The decision to delay should take into consideration patients’ values, preferences and beliefs.</td>
</tr>
</tbody>
</table>

Screening Interval

<table>
<thead>
<tr>
<th>RECOMMENDATION</th>
<th>RATIONALE</th>
</tr>
</thead>
<tbody>
<tr>
<td>In the absence of abnormal cytology, routine screening should be performed every 3 years. Health care providers should discuss the benefits and harms of screening with their patients.</td>
<td>Screening every 3 years maintains the benefits of screening while decreasing the harm from overscreening. • Shorter screening intervals (1-2 years) do not significantly decrease the incidence of cervical cancer more than screening every 3. • Annual screening significantly increases the number of women who are sent for further tests which increase the harms of screening. • Most countries recommend a 3.5 year interval.</td>
</tr>
</tbody>
</table>

The greatest reduction in cervical cancer will be achieved by screening eligible women who have not previously been screened, not by screening women earlier or more often.

To support the new guidelines, CervixCheck will be phasing in reminder letters to women who are overdue for a Pap test.

To support your patients’ understanding of the new guidelines, order our new resource for women, “Pap testing in Manitoba has changed: What you need to know” at TellEveryWoman.ca
